

Allotment Water Supply

Further to the last meeting and following a long call with Southern Water, I am in the process of arranging a meeting with one of their inspectors at Rublees to offer a further inspection. It appears that the supply is already in a line bore from the main that should be proficient enough to supply several hose supplies at once. So with this in mind it seems only logically to take the advice of the experts in water management into possibly causes and solutions, at the same time Southern water offer a number of water saving solutions that should and must also be investigated.

This project is far more than just a quick Phase 1 fix solution, before any solution is put to a vote all possibilities must be explored by the working party. We are in a time of climate emergency, so is supplying more water the first answer? We must think about the here and now but also consider the future (10yrs from now)
